This sequence is a binding site motif. This motif is used in a method for controlling the availability and signal transduction capability of a cell surface receptor by administering an inhibitor that is capable of inhibiting proteolytic cleavage of the receptor. Inhibition of this proteolytic cleavage results in the receptors being present on the surface for longer and therefore signalling for longer to the interior of the cell. This increases the sensitivity of cells to any hormones which might be present. The binding motif, is located at or around a ubiquitin and/or ubiquitin/proteosome complex binding site. The inhibitor of the method is either derived from, competes with, or binds to this binding motif. The inhibitor may be used to treat muscle wasting, associated with disorders such as renal tubular defects, uraemia, diabetes, Gushing's syndrome, cachexias, eating disorders, AIDS, after stress and during neuromuscular disease

Immunoglobulin E (IgE) receptor polypeptide.

Signal transduction; proteolytic cleavage; IgE receptor; proteosome binding site; muscle wasting; renal tubular defect; uraemia; diabetes; Cushing's disease; eating disorder; AIDS; ubiquitin; growth hormone deficiency; inhibitor; immunoglobulin E.

EP943624-A1 22-SEP-1999

Synthetic.

```
This sequence is derived from the growth hormone receptor polypeptide
AAY32792. This sequence and variants (AAY32794-Y32823) of it are examples
of polypeptide sequences found at or near the ubiquitin/proteosome
binding site located on the intracellular part of a cell surface
comport. These sequences are used in a method for controlling the
receptor. These sequences are used in a method for controlling the
availability and signal transduction capability of a cell surface
creceptor by administering an inhibitor that is capable of inhibiting
proteclytic cleavage of the receptor. Inhibition of this proteclytic
cleavage results in the receptors being present on the surface for longer and therefore signalling for longer to the interior of the cell. This
increases the sensitivity of cells to any hormones which might be
concreased the inhibitor is either derived from, competes with or binds to
a polypeptide sequence of which sequences AAY32323 are examples.
The inhibitor may be used to treat muscle wasting, associated with
disorders such as renal tubular defects, uraemia, diabetes, Cushing's
syndrome, cachesias, eating disorders, AIDS, after stress and during
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Growth hormone receptor; signal transduction; proteolytic cleavage; ubiquitin; proteosome binding site; muscle wasting; renal tubular defect; uraemia; diabetes; Cushing's disease; eating disorder; AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Controlling the availability and/or signal transduction capability of a cell surface receptor, useful for treating growth hormone deficiencies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Growth hormone receptor polypeptide for inhibition of receptor cleavage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence is from the intracellular domain of the growth hormone receptor. This sequence is an example of a binding site motif AAX32790. This motif is used in a method for controlling the availability and
                                                                         Controlling the availability and/or signal transduction capability of a cell surface receptor, useful for treating growth hormone deficiencies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 25; DB 2; Length 12;

Sequences (AAX32794-Y32823) are examples of polypeptide sequences found

at or near the ubiquitin/proteosome complex binding site located on the

intracellular part of a cell surface receptor. These sequences are used

in a method for controlling the availability and signal transduction

capability of a cell surface receptor by administering an inhibitor that

capable of inhibiting proteolytic cleavage of the receptor. Inhibition

of this proteolytic cleavage results in the receptors being present on

the surface for longer and therefore signalling for longer to the

the surface for longer and therefore signalling for longer to the

the surface for longer and therefore signalling for longer to the

This sequence is a polypeptide from the chicken growth hormone receptor. Sequences (AAY32794-Y32823) are examples of polypeptide sequences found at or near the ubiquitin/proteosome complex binding site located on the intracellular part of a cell surface receptor. These sequences are used in a method for controlling the availability and signal transduction capability of a cell surface receptor by administering an inhibitor that is capable of inhibiting proteclytic cleavage of the receptor. Inhibition of this proteclytic cleavage results in the receptors being present on the surface for longer and therefore signalling for longer to the interior of the cell. This increases the sensitivity of cells to any competes which might be present. The inhibitor is either derived from, competes which might be present. The inhibitor may be used to treat muscle AAY37794-Y32823 are examples. The inhibitor may be used to treat muscle wasting, associated with disorders such as renal tubular defects,
                                                                                                                                                                                                                                                                                                                                                                                        ;
signal transduction capability of a cell surface receptor by administering an inhibitor that is capable of inhibiting proteolytic cleavage of the receptor. Inhibition of this proteolytic cleavage results in the receptors being present on the surface for longer and therefore signalling for longer to the interior of the cell. This increases the sensitivity of cells to any hormones which might be present. The binding motif, of which this sequence is an example, is located at or around a ubsquitin and/or ubiquitin/proteosome complex binding site. The inhibitor of the method is either derived from, competes with, or binds to this binding motif. The inhibitor may be used to treat muscle wasting, associated with disorders such as renal tubular defects, uraemia, diabetes, Cushing's syndrome, cachexias, eating disorders, AIDS, after stress and during neuromuscular disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Signal transduction; proteolytic cleavage; growth hormone receptor; proteosome binding site; muscle wasting; renal tubular defect; uraemia; diabetes; Cushing's disease; eating disorder; AIDS; ubiquitin; growth hormone deficiency; inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Controlling the availability and/or signal transduction capability of a cell surface receptor, useful for treating growth hormone deficiencies.
                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention describes a purified polypeptide, which comprises a transporter, cytoskeletal protein, receptor or transcription factor. The transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified colypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I in Mic-binding polypeptide. The polypeptide as and polypeptide are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed
                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Translational profiling, expressed protein tag; EPT; kinase; phosphatase; protease; protease inhibitor; transporter; cytoskeletal protein; receptor; transcription factor; cancer; MHC; major histocompatability complex; myeloma; colon cancer; gastric cancer; adenocarcinoma; sarcoma; melanoma; lymphoma; leukaemia.

The assay comprises expressing in a cell a protein comprising the E region and sufficient C-terminal residues of a DP-3 protein to provide a functional nuclear localisation signal (NLS), or the NLS of B2F-1, and a marker for nuclear localisation. Then the degree of nuclear localisation in the presence and absence of the putative regulator is determined. Regulators identified using the assay can be used as potential regulators of cell projification, or as models for rational drug design. Regulation of the NLS may lead to effects such as enhanced cell division, blocking of cell cycle progression or apoptosis. The regulators may also be used to design
                                                                                                                                                                                                         ..

The invention relates to 2175 novel human ovarian antigens (ABP41054-CC ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also cencempasses polypeptides 90% identical and polynucleotides 99% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen to polynucleotides, antibodies against human ovarian antigens and the use of ovarian antigens of ovarian antigens, and the use of ovarian polynucleotides and polypeptides in diagnosing, treating, prognosing or perventing various ovary and/or breast cancer, and disorders. Such conditions include ovarian cancer and breast cancer, and clisorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorthoea), endocrine disorders, infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorthoea, endocrine cshock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired chooseficiencies, autoimmune ophoritis, systemic lupus erythematosus), cshock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and untimnary system disorders. (e.g., anaemia), cardiovascular disorders. December of confounder ovarian antigen expression or activity. The polynucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may be used as food additives or to prepare antibodies cuseful in disease diagnosis, dry targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence cepresents a human ovarian antigen of the printed in electron, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAX30724 to AAX30946 represent genomic DNA sequences isolated from Streptococcus pneumoniae strain 0100993. These genomic DNA sequences encode the novel proteins given in AAY1114 to AAY11367. The proteins, isolated from Streptococcus pneumoniae, can be used in vaccines against streptococcal infections and in assays for identifying compounds that inhibit or activate the activity of the proteins. The antagonists can be used to treat an individual having need to inhibit a bacterial protein. Vectors expressing the proteins can be used to induce a protective immune response in mammals

AXY97916 to AAXY98029 represent 110 isolated human secreted protein genes.
AXY36224 to AAXJ8727 represent the secreted proteins encoded by the 110 human genes. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliotating secreted polypeptides are by protein or gene therapy. Also pathological conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 110 genes, based on which tissues they are most highly expressed in, and include developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, autoimmune diseases, inflammation, allergies, Alabeimer, sand cognitive disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney disorders, atherosclerosis, disorders, infections and AlDS. The polypeptides are also useful for identifying their binding partners. The sequences given the AXX97907 to AAX97915 and AAX16223 are used in the exemplification of

The present sequence is that of amino acids 7-54 of a phospholipid transporter consensus sequence, denoted ATPase hydrolase phosphorylation transporter consensus sequence, denoted ATPase hydrolase phosphorylation. This sequence shows 564 identity with a phospholipid-transporting multigene. This sequence shows 564 identity with a phospholipid-transporter of the invention, designated 67108 (see ABP72495). The invention provides 67108 nucleic acids and polypeptides, vectors, host cells, antibodies and transgenic animals. The 61708 nucleic acids and polypeptides are useful for diagnosing, preventing or treating conditions related to aberrant activity or deficient phospholipid transporter function or expression, such as neurological disorders, callular proliferative and/or differentiative disorders, immune disorders, inflammatory disorders, viral diseases, cardiovascular disorders, blood coagulation disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New 61708 nucleic acid molecules and polypeptides, useful for diagnosing or treating conditions related to aberrant activity or deficient phospholipid transporter function or expression, e.g. autoimmune disease,
  increase or decrease storage capabilities, fat content or other nutritional components. The present sequence represents the amino acid sequence of a novel human secreted protein. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at seqdata.uspto.gov.uk/sequence.html?DocID=20030055236.
                                                                                                                                                                                                             Score 25; DB 6; Length 45;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated HXABT24 nucleic acid molecule. The polypeptides, mucleic acids and antibodies are useful for diagnosing a pathological condition.

For preventing, treating, or a meelicrating a medical condition, such as cancer, inflammation and other immune disorders, neurological and blood clotting disorders. The nucleic acids are also useful for chromosome identification, radiation hybrid mapping or long-range restriction mapping. The polypeptides and antibodies are useful for providing immunological probbs for differential identification of the tissues immunological probbs for differential identification of the tissues immunological probbs for differential identification dispense assays. The polypeptide, polynucleotide, agonist or antagonist may also be used as a food additive or preservative to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New secreted HKABT24 nucleic acid molecules and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation, immune disorders, neurological and blood clotting

The present invention relates to a new protein with scaffold structure of c-type lectin-like domains (CTLD). The invention comprises a variant of a model CTLD where alpha-helices and beta-strands and connecting segments are conserved such that scaffold structure of C-type lectin-like domains are conserved such that scaffold structure of C-type lectin-like domains (CTLD) is substantially maintained, while the 14loop region is altered by amino acid substitution, deletion, insertion or their combination. The invention is useful for preparing a library of nucleotide sequences conding related proteins by randomising part or all of the nucleic acid protein products are preferable to antibody derivatives as each binding components of compositions to be used for in vivo diagnostic or therapeutic purposes, arrificial CTLD protein domain. When used as components of compositions to be used for in vivo diagnostic or therapeutic purposes, arrificial CTLD protein products constructed on the cases of human CTLDs are virtually identical to the corresponding natural communogenic to the patient. They also have a smaller size, and thus provide tissue penetration and distribution, as well as shorter half life in circulation. Since murine and human tetranectin are identical in the invanion of plyapeptide segments defining certify any of any passenticity between murine and human tetranectin corresponding the present amino acid sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protein comprising a variant of model C-type lectin-like domains (CTLD), in which alpha helices, beta-strands, connecting segments are conserved to maintain CTLD scaffold structure, while the loop region is altered.
                                                                                                                                                                                                                                                                                                Scaffold protein; C-type lectin-like domain; CTLD; alpha-helix; beta-strand; connecting segment; 14loop region; tetranectin; ligand-binding specificity; human; mouse; rat; chicken; trout; cow.

The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Heia cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                    Peptide #3126 encoded by probe for measuring cervical gene expression.

Human gene

```
Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New spatially-addressable set of single exon nucleic acid probes, useful
                                                                                                                                                                                                                                                                                                        The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; microarray; single exon probe; gene expression; breast; disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide #3165 encoded by breast cell single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a poptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                    genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide #3216 encoded by probe for measuring placental gene expression.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
   for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.
                                                                                    SEQ ID NO 13482; 327pp + Sequence Listing; English.

Single exon nucleic acid probes for analyzing gene expression in human hearts.

```
The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, taging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular diseases of the hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow

Example 4; SEQ ID NO 29176; 658pp + Sequence Listing; English.

probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention The present invention provides a number of single exon nucleic acid

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. C(1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG9930 represent human colliformation for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide #3091 encoded by probe for measuring breast gene expression.
                                                                                                                                Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia,
hypercholesterolaemia, coronary heart disease.

They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                                                                         0
                                                                                                                                                                                                                                                                                                                                                Human brain expressed single exon probe encoded protein SEQ ID NO: 28596.
                                                                                                                                                                                                                                                                                                                                                                                    Human; brain expressed exon; gene expression analysis; probe; microarray;
Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer

The present invention relates to novel single exon nucleic acid probes (see AA100010-AA10067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a predicting, diagnosing, stading, stading, monitoring and prognesing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include breast cancer, disorders of development inflammatory diseases include breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours. Note: The sequence data for obtained in electronic format directly from WIPO at

The invention features to a spatially-addressable set or single exon mucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung; measuring are expression in a sample collection of detectably labeled nucleic acids derived from human lung contracting the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in a eukaryotic genome, comprising (a) array; identifying at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridiation of detectably labeled nucleic acids from eukaryote; bung meanury a single exon probe in the above mentioned microarray; assigning exons to a single exon probe having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that the expression of the exons in the tissues and/or cell types using hybridisation to a single gene; a peptide comprising one collectived mentaling frames (ORP). The probes are used for identifying exons in a gene, particularly using human cancer, chronic obstructive pulmonary diseases (DOPD), interstrial lung derived mentaling indopathic pulmonary envised mentaling is unlamental mulmonary mulmonary envisementalin

The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited from isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can threfore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0

The present invention describes an Oropouche NP (nucleocapsid) protein. The Oropouche virus belongs to the genus Bunyavirus of family Bunyaviridae. The Oropouche NP protein can be used to detect anti-NP antibodies, for diagnosis of Oropouche virus infection and for protein is used to design: (i) oligonucleotide primers for diagnostic reverse transcription polymerase chain reaction (RT PCR) of viral RNA in infected cell cultures or serum samples; or (ii) probes for hybridisation reactions with viral RNA. Also, the nucleic acid sequence may be used in vaccines to protect against Oropouche virus infection. The present sangles and Oropouche virus infection. The present plasmid, which is used in an example from the present invention. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                              New DNA encoding the nucleocapsid protein of Oropouche virus - used for diagnosing Oropouche virus infection and in vaccines against this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; foetal liver; gene expression; single exon nucleic acid probe.

                                                                                                                                                                                                                                                               0;
                                                                                                         The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                        Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for
                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide #11098 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which hay enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human genome-derived single exon nucleic acid probes useful for analyzing

```
probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                                                                                                                     Human brain expressed single exon probe encoded protein SEQ ID NO: 36233.
                                                                                                                                                                                                                                                                                                                 Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a number of single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia; hypercholesterolaemia; coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 4; SEQ ID NO 36233; 650pp + Sequence Listing; English.

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at fire vipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0

The invention relates to a spatially-addressable set of single exon muchaic acid probes for measuring gene expression in a sample derived from thuman lung comprising single exon nucleic acid probes having one of romplements our their specification, or their complements our the 12819 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes complements our the 12819 open reading frames derived from the 12614 probes. Also included are a microarray comprising the array with a sample derived from human lung, comprising (a) contacting the array with a sample collection of detectably labeled nucleic acids derived from human lung array. Them is a sample derived from human lung comprising (a) detectably bound to each probe of the array identifying exons in a everatoric genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the ewarayce; and (b) detecting specific hybridisation of detectably labeled nucleic acids from expression of a single exon in the above mentioned microarray; assigning exons to a single exon in the above mentioned microarray; assigning exons to a single exon in the above mentioned microarray; assigning exons to a single exon microarray and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon microarray having a probe with the exon, where a common pattern of expression of the exons should be assigned to a single gene, a peptide comprising one of the exons should be assigned to a single gene, a periodacity using human lung derived mRNA and for the study of lung diseases such as asthma, lung canner, chronic obstructive pulmonary disease (IDD), intersity using human lung derived mRNA and for the study of lung diseases such as astimated of sucher's disease, Hermansky-histiocytosis, lymphangioleionymonicals, pulmonary dysplasis, prime are periodesis, pulmonary dysplasis, pulmonary dysplasis, pulmonary hypertension and hyaline membrane dise

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        08-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         14-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         17-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      18-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          24-MAY-1999
 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recarion (PGN) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and to appear in the printed specification, but was obtained in electronic format directly from WIPO at the sequences

C patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .,

                                                                                                                                                                       The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                            New protein from Neisseria gonorrheae, useful for the manufacture of medicament for treating or preventing N. gonorrheae infection.

Š Ruben (HUMA-) HUMAN GENOME SCI INC. Rosen CA, Barash SC,

WPI; 2001-488783/53. N-PSDB; AAS26587 New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives.

Claim 11; SEQ ID NO 1553; 980pp; English.

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic

```
immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays

(BLISA). Disorders which are diagnosed or treated include autoimmune

diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g.

closedlasms of the breast or liver, cardiovascular disorders e.g. cardiac

arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis,

carlest, cerebrad fungi and ocular disorders e.g. corneal infections

con also be used to aid wound healing and epithelial cell proliferation,

2002-626554/67. WPI; 2002-626554/ N-PSDB; ABQ98811. New polypeptide designated ORFX are present in human atherogenic cells and are useful to prevent and treat ORFX-associated disorders including cancer, allergy, wound healing or autoimmune, cardiovascular or inflammatory disease.

Claim 10; SEQ ID NO 1236; 78pp; English.

The present invention relates to novel human ORFX polypeptides and their coding sequences (ABP63631-ABP64681 and ABQ98194-ABQ99267). The sequences

data
were discovered in human atherogenic cells, in particular in platelets and human unbilical vein endothelial cells (HUVEC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX associated disorder, e.g. canner, cardiovascular disease, allergy, autoimmune disease, wound healing, bloo coagulation disorders or inflammatory disorders. Note: The sequence data for this patent did not form part of the printed specification, but was segdata.uspto.gov/sequence.html?bocID=20020082206
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; neural disorder; immune system disorder; renal disorder; muscular disorder; disorder; disorder; disorder; pulmonary disorder; cardiovascular disorder; pulmonary disorder; cardiovascular disorder; pulmonary disorder; cardiovascular disorder; hyperproliferative disorder; inflammatory disease; allergic reaction; blood related disorder; cancer; immunosuppressive; antinflammatory; cardiovascular; nephrotropic; cytostatic; antiallergic; thrombolytic; haemostatic; antiatlergic; thrombolytic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human novel polypeptides and their associated polymucleotides. The polypeptides and polymucleotides are useful in gene therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. system; lupus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g. nasal vestibulitis, nasal polyps and sinusitis), reproductive disorders, gastrointestinal disorders, pulmonary disorders, cardiovascular disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left (e.g. congenital heart defects, e.g. acute kidney failure and end stage creal disease), hyperproliferative disorders (e.g. Hodgkin's disease and clenkaemia), inflammatory diseases (e.g. septic shock, bursitis and spendicitis), allergic reactions and conditions (e.g. asthma), blood related disorders (e.g. thrombosis, atherosclerosis and myocardial infarction) and cancerous diseases. Sequences ABUS4914-ABUS5699 and ABUS5748 represent human novel polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0;

The present sequence is a polypeptide encoded by one of a large number of 5. ESTB derived from mRNAs encoding secreted proteins. The 5. ESTB were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3. untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTB are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTB are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTB
                                                                                                                                                                                                                                                                are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

The invention describes a complex of protein-protein interactions in Helicobacter pylori selected from 421 complexes given in the specification. The complex of protein-protein interactions are useful for screening for agents which modulate the interaction of proteins. Modulating compounds which binds to a targeted bacterial protein may be used for treating or preventing ulcers in a human or animal. This is the amino acid sequence of a selected interacting domain (SID), identified via protein-protein interactions. Note: Where the patent number printed at the top of the pages in the specification has obscured areas of protein sequence, the indexer has replaced the residue with an X to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;

                                                                                                                                                                                                                                                                                                                                                                                                                               Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                              New protein from Neisseria gonorrheae, useful for the manufacture of a medicament for treating or preventing N. gonorrheae infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New complexes of protein-protein interactions in Helicobacter pylori, useful for identifying modulating compounds for treating or preventing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                               present invention relates to proteins from Neisseria gonorrhoeae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protein-protein interaction; ulcer; selected interacting domain; SID.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Helicobacter pylori selected interacting domain (SID) protein #1236.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

Screening for non-ocular disease - by analysing tears for marker proteins, particularly indicative of cancer and genetic disease, also new proteins and nucleic acid encoding them.
disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with OREX-associated disorder. OREX polymuclectide sequences can be used in pene therapy. OREX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, Reloid, degenerative disorders, haemorrhage, osteoarthriis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic tupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple solerois, rhematoid
                                                                                                                                                                                                arthritis, autoimmune thyroidis, myasthenia gravis, graft-versus-host disease and autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerating disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The markers AAW61647-W61649 are used for screening for, or detecting, non-ocular disease by analysing tears. Biochemicals, specifically proteins, are isolated from tears, particularly by chromatography or electrophoresis, especially two-dimensional polyacrylamide gel electrophoresis (2D-PAGB), then detected, e.g. with labelled specific reagents, in (radio)immunoassay. The method is used to detect cancer,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                 epidermidis; open reading frame; ORF; bacterial infection;
particularly of breast or prostate, or a genetic disease, in humans or

```
Streptococcus pneumoniae polynucleotides - useful for developing products for diagnosis, prevention and treatment of infections e.g. pneumonia, bacteremia, meningitis or endocarditis.
                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is that of a Streptococcal polypeptide. The polypeptide can potentially be used for the diagnosis and prevention of bacterial infections, especially SP infection. It may be used for the treatment of diseases such as otitis media, conjunctivitis, pneumonia, bacteremia, meningitis, sinusitis, pleural empyema, endocarditis or infection of the cerebrospinal fluid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypethyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated Acinetobacter baumannii nucleic acids

The present invention describes substantially purified human proteins

(referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABD0010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX associated disorder. ORFX polymucleotide squences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arbitis, autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoprosis, bone degenerative disorders, or periodontal disease, and for gut reading virture, in various reader to reading osteoprosis, constitution in the profession or reading osteoprosis, constitution in the profession or periodontal disease, and for gut reading or injury, in various end treatment of lung or liver form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences

This sequence is a plant aminoacyl-tRNA synthetase of the invention. The aminoacyl-tRNA synthetases are selected from isoleucyl-tRNA synthetase, ipenylalanyl-tRNA synthetase, phenylalanyl-tRNA synthetase, and prolyl-tRNA synthetase, phenylalanyl-tRNA synthetase, and prolyl-tRNA synthetase. The nucleic acid fragments may be used to create transgenic plants in which the polypeptides are present at higher or lower levels than normally found. This would have the effect of altering the level of aminoacyl-tRNA synthetase activity and gene expression in those cells. The polypeptides can be used as a targets to facilitate design and/or identification of inhibitors of those enzymes that may be useful as herbicides. All or a substantial portion of the nucleic acid fragments may also be used as probes for genetically and physically mapping the genes. Such information may be useful in plant breeding in order to chose genes. Such information may be useful in plant breeding in order to
                                                                                                                                           Isolated polynuclectide encoding plant isolewcyl-tRNA synthase, useful for creating transgenic plants and as targets to facilitate design and/or identification of inhibitors that may be useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                              28-MAY
isolencyl-tena synthetase, a lysyl-tena synthetase, a phenylalanyl-tena synthetase, or a prolyl-tena synthetase. The nucleic acid fragments encoding aminoacyl-tena synthetases are useful in developing new herbicides that target aminoacyl-tena synthetases and engineer aminoacyl-tena synthetases and engineer aminoacyl-tena synthetases and engineer aminoacyl-tena synthetases that are resistant to the herbicides. The nucleic acid profesion synthesis in plants, providing studies to better understand protein synthesis in plants, providing genetic tools for the manipulation of gene expression, or providing possible target for herbicides. The polypeptides are useful as targets to facilitate design and/or identification of inhibitors of the aminoacyl-tena synthetases that may be used as herbicides. This is the aminoacyl-tena synthetases that may be used as herbicides. This is the amino acid sequence of rice isoleucyl-tena synthetase clone rls2.pk0006.clo
                                                                        New nucleic acid fragments encoding aminoacyl-tRNA synthetases, useful in developing new herbicides that target aminoacyl-tRNA synthetases and engineer aminoacyl-tRNA synthetases that are resistant to the herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                       The invention describes an isolated nucleic acid fragment encoding an

The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an B-value greater by a factor of 3 than the B-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms.
                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                 .

The present invention describes substantially purified human proteins

(referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX in the specification). ABN15762 to ABN27252 encode the human ORFX in the specification). ABN15762 to ABN27252 encode the human ORFX is considered to proteins given in ABD0010 to ABN12700. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX associated disorder. ORFX polynucleotide squences can be used in Gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoathritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertrension, hypothyroidism, cholesterol ester storage disease, autoimmune disorders such as multiple sclerosis, rheumatoid atthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ·;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        form part of the printed specification, but was obtained in electional format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

This sequence comprises human endometrial specific steroid binding factor III (ESF III), a protein that inhibits phospholipase A2 activity, binds to polychlorinated biphenyl compounds, reduces foreign protein antigenicity, inhibits monocyte and neutrophil chemotaxis and phagocytosis, inhibits monocyte and neutrophil chemotaxis and controls the growth of endometrial cells. The amino acid sequence was deduced from a CDM clone (see AAT94832) derived from a human endometrial tumour. ESF I (see AAW35802) and ESF II (see AAW35802) and ESF II (see CAW35803) are also claimed. Human ESF III has about 36% identity with rat prostatic steroid-binding protein. Recombinant ESF I, II and III can be expressed in host cells for use in claimed methods (a) for treating a patient in need of ESF I, II or III (including expression of the patient in need of ESF I II or III (including expression of the compounds which bind to and inhibit activation of the ESF polypeptide. HESF I, II and III may be used to the treating a compounds which the Library compounds which thind the contraction of the ESF polypeptide. HESF I, II and III may be used to the test inflammation, asthma, rhinitis, cystic fibrosis, airway disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   - used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Endometrial specific steroid-binding factor III; ESF III; human; Clara cell secretory protein; endometrium; phospholipase A2 inhibitor; polychlorinated biphenyl; antiaggregant; inflammation; asthma; rhinitis; cystic fibrosis; airway disease; neoplasia; atopy; therapy; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human endometrial specific steroid-binding factor I, II and III - used
treat inflammation, asthma, rhinitis, cystic fibrosis, airway disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human endometrial specific steroid-binding factor III.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1. .21

```
and quantitate gene expression in biopsied tissues. With respect to cancer a relatively high amount of transcript may indicate a predisposition for the development of disease. The nucleic acid sequences which encode HWH may also be used to generate hybridization probes useful for mapping the naturally occurring genomic sequence. HMH, and its fragments/variants can be used for screening libraries of compounds in drug screening techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a human mammoglobin homologue (HWH). Antagonists of the HMH polypeptide can be used to treat neoplastic disorders including adenocarcinoma, leukemia, lymphoma, melanoma, myeloma, sarcoma and teratocarcinoma. A vector expressing the complement of the polynucleotide encoding HMH may be administered to a subject to treat or prevent neoplastic disorders or endometriosis. Antibodies which bind HMH may also be used in the diagnosis of conditions or diseases characterized by expression of HMH, or in assays to monitor patients being treated with HMH, agonists, antagonists or inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human mammoglobin homolog (HMH), useful for diagnosing, treating or preventing disorders associated with expression of HMH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                 Human manmoglobin homologue, HMH; antagonist; neoplastic disorder;

This invention relates to nucleic acid molecules encoding portions of the human endometrial specific steroid-binding factors I, II, and III. Also included in the invention are hESF I, II, and III polypeptides sequences. The included in the invention are hESF I, II, and III polypeptides sequences. The included in the invention are hESF I, III and III polypeptides are used in gene therapy to express hESF I, II and III polypeptides in vivo to treat and/or prevent inflammation, asthma, rhinitis, cystic fibrosis, air way disease, neoplasia and actory. The polymuclectides are also used to inhibit phospholipase A2 activity, bind polychorinate binded biphenyls, reduce foreign protein antigate, inhibit monocyte and neutrophil chemotaxis and phagocytosis, inhibit platelet aggregation, regulate elossanoid cand phagocytosis, inhibit platelet aggregation, regulate elossanoid conceptions in the human uterus and control the growth of endometrial cells. The polymucleotides are also useful for detecting complementary polymucleotides are used to detect complementary polymucleotides such a disgnostic reagent. The hESF I, II and III associated with a dysfunction will provide a diagnostic tool that can define diagnosis of a disease or susceptibility to a disease which can mador-expression, over-expression of an endometrial cancer. They are also useful for chromosome identification.

The present sequence represents a hESF III protein sequence identified in
                                                                                                                                   Endometrial specific steroid-binding factor; human; hESF; inflammation; asthma; rhinitis; cystic fibrosis; air way disease; neoplasia; atopy; eicosanoid level regulator; chemotaxis inhibitor; endometrial cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel gene encoding human endometrial specific steroid-binding factor I, II and III which is useful for treating asthma, rhinitis, cystic fibrosis, airway disease and neoplasia.
                                                                                           Human endometrial specific steroid-binding factor III protein sequence.

```
represent the EST-related proteins corresponding to AAX65651 to AAX65438

Crepresent the EST-related proteins corresponding to AAX42665 to AAX43052.

The 5' BSTs can be used for producing screted human gene products. They

can be used to identify and isolate 5' untranslated regions (UTRS) and

cupstream regulatory regions which control the location, development

creptage, rate, and quantity of protein synthesis, as well as stability of

mANA. The ESTs are also useful as probes for chromosome mapping, and to

chain full length cDNA clones. The ESTs can also be used in forensic

contain full length cDNA clones. The ESTs can also be used in forensic

contain full september of identify individuals, or in diagnostic procedures to

cidentify individuals paring genetic diseases resulting from abnormal gene

expression. The products may also be used in gene therapy protocols. The

concleic acids encoding signal peptides can be used for directing

extracellular secretion of a polypeptide or the insertion of a

colypeptide into a membrane, or importing a polypeptide into a cell. The

proteins encoded by the EST sequences may be useful in treating a variety

colf human conditions. Secreted proteins have therapeutic value, and the

colf human conditions respected proteins is valuable. AAZ42249 to AAZ42264

colf human conditions represent sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô

Clone Mamm-X encodes a polypeptide that is 100 pecent identical to human Mammaglobin B precursor, a potential marker of breast cancer nodal metastasis. The sequences are useful for treatment of diseases such as cancer, immune disorders, autoimmune disease, acquired immune deficiency syndrome (AIDS) transplant rejection, allergy, infection by a pathological agent or organism, inflammatory disorders, arthritis, a haematopoietic disorder, a skin disorder, atherosclerosis, restenosis, a neurological disease, Alzheimer's disease, trauma, spinal cord injury and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The levels of human endometrial specific steroid binding factor (ESBPIII) can be measured and compared to control levels and used to diagnose the presence of a gynaecological (uterine, breast, endometrial, or ovarian) cancer in a patient. ESBPIII levels can also be used to diagnose metastasis, to stage or monitor gynaecological cancer. Antibodies specific for ESBPIII can be used to treat gynecological cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    staging and monitoring gynecological cancer comprising using level of ESBPIII in a patient as an indicator of cancer.

                                                                                                                         à
                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a peptide comprising the amino acid sequences of human lipophilin A, B, or C or its allelic variant or fragment comprising at least one immunogenic epitope, which is purified and isolated, and may have the N-terminal acylated and/or C-terminal amidated or be a fusion protein. Molecules of the invention are used in the diagnosis and prognosis of malignant tumours associated with hormonally regulated organs such as uterus, ovary, prostate, testis, breast, kidney and thymus. This sequence represents the human Lipophilin C protein of the
                                                     The present sequence represents a human endometrial specific steroid hinding factor (hESF). The specification describes hESF1, hESFI1, and hESFIII. I and III polypeptides, and polymucleotides encoding them are useful for treating and preventing inflammation, asthma, inhibiting phospholipase A2 activity, binding polychlorinated biphenyls, reducing foreign protein antigencity, inhibiting monoryte and neutrophil chemotaxis and phagocytosis, inhibiting platelet aggregation, regulating chosping in the human uterus, and for controlling the growth of endometrial cells. hESF polypeptides and nucleotides are also useful for research, biological, clinical or therapeutic purposes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptides having the sequence of human lipophilin A, B and C are associated with carcinomas of hormonally regulated organs and are useful in the diagnosis and prognosis of various cancers.
                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunogenic epitope; hormonally regulated organ; malignant tumour; Lipophilin; human.
                                                                                                                                                                                                                                                                                                             .

The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterisaing cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing ovarian cancer (e.g. patients having a familial history of ovarian

testicular disorders (e.g. nontuberculous granulomatcus orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disease or atherosclerosis). The compositions and methods may also be used in assessing the histological type of neoplasm associated with ovarian cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metastasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the ovarian carcinogenic potential of a compound, or inhibiting ovarian cancer or at risk of developing ovarian cancer. The present amino acid sequence represents one of the ovarian cancer markers described in the
           of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Alzheimer's disease or Parkinson's disease), brain disorders (e.g. cerebral oedema, hydrocephalus or brain herniations), inflammations (e.g. bacterial or viral meningitis or encephalitis),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antibody specific for human endometrial specific steroid-binding factor (hESF) III, useful for detecting hESF III protein in biological sample and to isolate or identify clones expressing the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, endometrial specific steroid-binding factor; BSF;
prostatic steroid-binding protein; hBSF I; hBSF II; hBSF III; asthma.

0
factor (hESF) III. The full length protein has a molecular weight of 8.10 KDB. The protein has homology to rat prostatic steroid-binding protein C3. Antibodies which bind hESF proteins, such as hESF I, hESF II, and hESF III are useful for isolating or to identify clones expressing the bolypeptides or to purify the polypeptides by affinity chromatography. Agonists and antagonists of hESF proteins are useful for treating and/or preventing susceptibility to asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     endometrial specific steroid-binding factors 1, II and III (HESF I, II and III), and the nucleic acids encoding them. The HESF polypeptide has homologies to mammalian Clara cell 10 kba (CCIO) secretory protein and rat prostatic steroid-binding protein which are factors which modulate or mediate the action of hormones involved in the regulation of functions of the lung and uterus. The nucleic acids and polypeptides can be used to identify compounds that bind to and inhibit activation, raise antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACC50076 to ACC50334 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     expression
or develop antagonists against the isolated hESF polypeptide. The polypeptides or polymuclectides are useful for treating a patient having a need of hESF I, hESF II, hESF III or for treating a patient having a need to inhibit hESF. The polypeptide is administered by providing to the patient the DNA encoding the hESF polypeptide in vivo (gene therapy). In paticular, the disease is asthma. The hESF polypeptides or polymuclectides are also useful for diagnosing a disease or a susceptibility to the disease. The sequence presented is the hESF III

The DNA and protein sequences of the invention are useful for the diagnosis and treatment of cancer and inflammatory bowel disease (e.g. ulcerative colitis or Crohn's disease). The present amino acid sequence represents a human PRO protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New PRO polynucleotide and polypeptide, useful for the manufacture of a medicament for diagnosing or treating cancer or inflammatory bowel disorder e.g., ulcerative colitis or Crohn's disease.
N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBZ7737-ABBZ2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                         Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1) in the specification). ABN15762 to ABN27525 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polymoucleotide syndrome associated with ORFX-associated disorder. ORFX polymoucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, of psoriasis, bening tumnours, keloid, degenerative disorders, haemornhage, of treatment of cancer, hyperproliferative disorders related to organ transplantation, cardiovascular diseases, disorders mallitus, systemic control of the control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0-JUN-
   ..
                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is wheat aspartyl-tRNA synthetase of the invention. The aspartyl-tRNA synthetase are used as targets to facilitate designing and identification of inhibitors of the enzymes which are useful as herbicides. All or a substantial portion of the nucleic acid fragments of the present invention are used as probes for genetically and physically mapping the genes that they are a part of, and as markers for traits linked to those genes. Such information is useful in plant breeding in order to develop lines with desired phenotypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;
                                                                                                                                                                                                                                                                                      New isolated polynucleotide encoding an aspartyl-tRNA synthetase useful as targets to facilitate design and/or identification of inhibitors of those enzymes that may be useful as herbicides.

       The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for baumannii protein.
                                                                                                                                                                    Gaps

Arabidopsis thaliana. LSD1 interacting genes (see AAV66755-67) were isolated from a yeast gene expression library constructed in plasmid pJG4 solated from Arabidopsis leaves infected with Pseudomonas syringae. A two-hybrid system was used with LSD1 short and long open reading frames (see AAV66750-51) as bait. LSD1 (see AAW7236-67) is a novel polypeptide that regulates the initial response of plants to pathogens and the subsequent spread of plant cell death engendered by infection. Since the inactivation of LSD1 by mutation leads to enhanced disease resistance, enhanced resistance to pathogens. Thus, the invention includes all proteins (see AAW72384-96) that interact with the cell death regulator This is the amino acid sequence of LSD1-interacting protein 00 of Claim 46; Page 65; 88pp; English.

New isolated Arabidopsis genes - useful for producing transgenic plants which show resistance to cell death caused by pathogens or herbicides.

Sequence 101 AA;

·, designated ORF (open reading frame) 1-4534, and sequences ABN75054ABN79587 represent cDNAs encoding them. The invention also encompasses
polypeptides at least 80% identical to the ORF1-ORF4534 (collectively
referred to as ORFX) proteins, polynucleotides at least 85% identical to
the ORFX nucleic acid sequences, vectors and host cells comprising ORFX
polynucleotides, the recombinant production of ORFX proteins, antibodies
specific for ORFX proteins, methods of detecting ORFX polynucleotides and
activity, and methods of screening for modulators of ORFX expression or
activity, and methods of screening individuals for a predisposition to an
ORFX-associated disorder. The ORFX proteins of the invention have a wide
range of biological activities, such as cytokine, cell proliferation,
tissue growth, angiogenesis, activin or inhibin activity, chemotactic/
chemokinetic activity, haemostatic activity, thrombolytic activity, Human; ORF; open reading frame; ORFX; drug screening; diagnosis; disease monitoring; cytokine; cell proliferation; cell differentiation; immune modulation; haematopoiesis regulation; tissue growth; angiogenesis; activin; inhibin; chemotactic; chemokinetic; haemostatic; thrombolytic; tumour inhibition; bodily characteristic; fertility; behaviour; cancer; proliferative disorder; neurological disorder; cardiovascular disease; immune system disorder; organ transplantation; tissue growth disorder; tissue regeneration disorder; diabetes mellitus; hypothyroidism; cholesterol ester storage disease; infection; vulnerary; vasotropic; antipsoriatic; antidiabetic; cytostatic; nootropic; neuroprotective; antietherosclerotic; anticoagulant; thrombolytic; cardiant; hypotensive; antithyroid; antiinflammatory; immunomodulator; dermatological; analgesic; virucide; antibacterial; fungicide. cc receptor/ligand, antinflammatory activity, tumour inhibition activity, and antinfective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. OFEX proteins, concluded antibodies may be used in the treatment of cancers, concluded actions and antibodies may be used in the treatment of cancers, concluded antibodies may be used in the treatment of cancers, contexpolated disorders such as psoriasis and benign tumours, contexpolated disorders such as epilepsy and Alaheimer's disease, cardiovascular diseases, immune system disorders; disorders related to organ transplantation, disorders of tissue growth and regeneration, diseases such as diabetes mellitus, hypothyroidism, and cholesterol ester storage diseases, and infectious diseases caused by viral, bacterial, chungal and other pathogens. ORRY mucleic acids may also be used as a source of primers and probes, in the detection of ORPX genomic sequences or transcripts, in the identification and cloning of homologous contensorables, in the identification and cloning of homologous sequences, in genetic diagnosis, and in forensic biology. The ORFX nucleic acids may additionally be used to produce transgenic animals which may be useful for studying the function and/or activity of ORFX protein, and in drug screening. The ORFX proteins may also be used as immunogens to generate specific antibodies, which are useful in the configuration of ORFX-associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotides encoding full-length polypeptides, e.g. secretory and/or membrane proteins, useful for developing medicines for diseases in which the gene is involved, or as target molecules for gene therapy.

                                                                                                                 Gaps
proteins (ADA54072-ADA55710) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.
                                                                                                                   .,

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB146'08-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. In the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, or solated as set of solated and other cancer. Inver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, cardiovascular disorders such as myocardial ischaemias; (d) wound healing (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) cardiovascular diseases such as viral, bacterial, fungal and parasitic infections diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly come with the printed specification, but was obtained in electronic format directly come in the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nervous system antigen polypeptides, and/or treating nervous system cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 11; SEQ ID NO 6027; 1701pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 25; DB 4; Length 106; 50.0%; Pred. ```
The invention relates to isolated nucleic acids encoding plant stress response proteins (including peptide-methionine sulphoxide reductases) appearing as ABMUS8148 46 (or a protein 80% identical to them) from a pertaing as ABMUS8148 46 (or a protein 80% identical to them) from a mays, Oryza sativa, Glycine max, or Triticum aestivum. Also included are expression cassettes, transformed host cells, transgenic plants/seeds, modulating the level of peptide-methionine sulphoxide reductase in a plant and a computer system/data processing system for identifying, analysing, or modelling a genetic sequence. The plant nucleic acid is useful in developing strategies to improve plant response to stress (e.g. drought, heat, radiation or pathogen attack), engineering plants with increased disease and stress resistance, manipulating DNA repair and recombination efficiency, manipulating intracellular protein transport, and improving/protecting grain flavour. The nucleic acids may also be used as probes or amplification primers in the detection, quantitation or isolation of gene transcripts, for recombinant expression of encoded polypeptides, as immunogens in preparing or screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptide-methionine sulfoxide reductase and nucleic acids, useful in improving plant response to stress, engineering plants with increased disease and stress resistance, or and improving/protecting grain flavor.
                                                                                                                                                                                                                                           Plant; EST; expressed sequence tag; stress response; drought; heat; radiation; pathogen attack; grain flavour; disease resistance; peptide-methionine sulphoxide reductase; DNA repair; enzyme; intracellular protein transport.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rafalski JA;

antibodies, and in sense or antisense suppression of one or more genes in a host cell, tissue or plant. The proteins may be used as immunogens or antigens to obtain antibodies specifically immunoreactive with the protein, and in assays for enzyme agonists or antagonists. The present sequence is a plant stress response protein (or fragment)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             equivalent of sequences hybridising to [1]. Also included are a recomplement or sequences hybridising to [1]. Also included are a recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid. The nucleic acids are chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions resulting from E. faecium bacterial infection (e.g. urinary tract infection, bacteraemia, endocarditis, wounds and abdominal-pelvic infection, and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans and vaccines containing the nucleic acid are useful for recombinant production of candida albicans and vaccines containing the nucleic acid are useful for preventing or treating Enterococcus faecium infections. The present sequence represents one if the disclosed E. faecium proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid derived from blaterococcus faecium encoding an Entercoccus faecium enclypeptide having one of 10 fully defined sequences given in the (or comprising 40 sequential nucleotides chosen from any of the nucleic acids, its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid derived from Enterococcus faecium encoding an
